

My name is Peyton Livelli, and I am a senior studying cybersecurity. This past summer, I held a position as a cybersecurity intern at a software consulting company where I got hands-on experience with the kind of work I hope to do after graduation. My work consisted of software scanning, AI pen testing, and AI assisted coding for my own self-led project. This is where I learned a lot about how AI can be used as a tool but also where it has its limits.

For my weekly reflections, I have chosen to post them on a GitHub repository. GitHub is the platform I feel most comfortable with since I already use it fairly regularly for work and personal projects, so keeping my reflections there means my writing lives alongside the rest of my technical work. I will also be able to look back on my previous versions at the end of the semester to see how I've grown.

I plan to work with Claude as my AI tool for the semester. I spent a large amount of time using Claude Code over the summer, so I already have a sense of where it is useful and where it falls short, and I currently pay for a subscription, which means I will have consistent access for the whole semester.

At the end of my time as an intern, I started to experiment with pipelines, so I would like to somehow incorporate that into whatever I decide to create this semester. I was specifically working with Jenkins locally but want to learn how to expand my skills to make the pipelines effective across machines.
